

KAUST ACADEMY - Intro to Cybersecurity 2026 - SEED

SEED Labs on Apple Silicon

This is a guide on how to set up SEED Labs on M2/M3/M4 MacBooks. If you come across any difficulties during the set-up, please ask for help from the TAs or feel free to message me on [LinkedIn](#).

Requirements:

1. Ubuntu 22.04 - You can download it from [here](#).
2. UTM - A hypervisor to run the virtual machines. Click [here](#) to install.

Let's start to set up!

1 - Open UTM to set up the virtual machine. Follow these steps in UTM:

1. Create Virtual Machine
2. Custom: Virtualize
3. Operating System: Linux
4. Hardware: leave as is
5. Linux: boot from ISO, browse → "ubuntu-22.04.5-live-server-arm64.iso"
6. Storage: leave as is
7. Shared Directory: leave as is
8. Summary: set 'Name' to Ubuntu

2 - Now that we have the VM set up, we need to make a few adjustments. Let's edit the VM:

1. Edit by double-clicking the vm → Edit
2. Devices New → Serial → Save

3 - Reopen Kali Linux and use the window with "Terminal 1" in the name. Follow default installation, most importantly don't forget to set username and password. After finishing press reboot and after that shut down your vm.

4 - Remove the ISO image and the recently added serial from UTM.

5 - Reopen Ubuntu and login.

6 - Run the following commands in order, this will install a GUI for us:

```
sudo apt update  
sudo apt install ubuntu-desktop
```

7 - After it finished installing, run:

```
sudo reboot
```

8 - Now that we have a desktop, login with your credentials.

9 - To continue we need to download a bidirectional clipboard:

```
sudo apt update  
sudo apt install spice-vdagent spice-webdavd
```

10 - Reboot

```
sudo reboot
```

11 - We can now copy and paste using Ctrl+Shift+C and Ctrl+Shift+V, now we need to install the SEED labs:

```
sudo apt-get install curl
```

```
curl -o src-arm.zip https://seedsecuritylabs.org/setup/src-arm.zip
```

12 - To unzip run:

```
sudo apt update  
sudo apt -y install unzip  
unzip src-arm.zip
```

13 - Move to the 'src-arm' folder and install the software, when prompted choose 'No' for Wireshark (this will take a while):

```
cd src-arm  
sudo ./install.sh
```

14 - To switch to SEED labs:

```
sudo su seed
```

15 - To make sure everything your setup is right run the following, you should see 2 users/lines:

```
who
```

DONE!
